

Master Architectural Decision Records (ADR Collection)

Cost-Optimized Hybrid Production Architecture (\$13.09 Baseline)

Canmee Dairies Enterprise System

Document Version: 1.0.0 (Cost-Optimized Hybrid Baseline)

Status: Approved / Production Financial Standard

Standard Format: Michael Nygard's MADR (Markdown Architectural Decision Records) v3.0

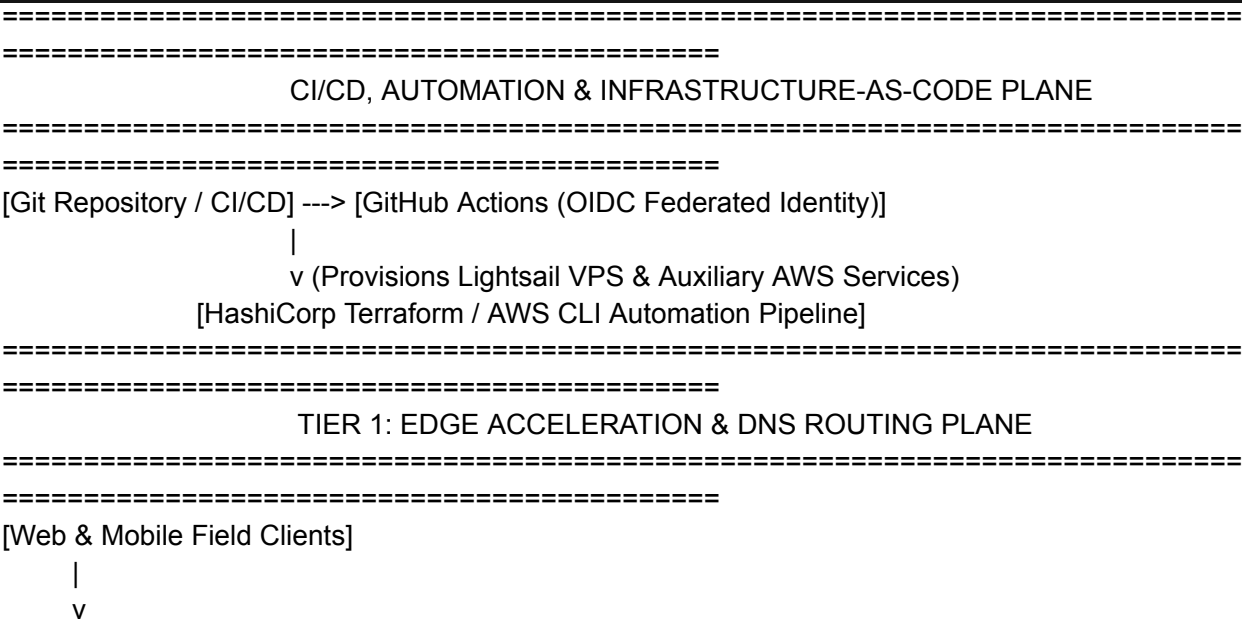

Target Cloud: Amazon Web Services (AWS) — Primary Region: `ap-south-1` (Mumbai / Sri Lanka Proximity)

Primary Domain: `admin.canmeedairies.lk` (Secondary: `canmeedairies.lk`, `www.canmeedairies.lk`)

Primary Timezone: `Asia/Colombo` (UTC+05:30)

Total Monthly Infrastructure Cost: **\$13.09 USD / month** (Annualized: **\$157.08 USD / year** | Upfront Liability: **\$0.00 USD**)

1. Master Architecture Topology & Service Boundary Map

2. Master Architecture Decision Index

ADR ID	Decision Title	Status	Primary AWS Service / Technology	Architectural Tier Alignment	Monthly Impact
ADR-001	<u>Cloud Provider Ecosystem & Regional Proximity Selection</u>	Accepted	AWS Core (ap-south-1 Mumbai)	Governance & Networking	Baseline Anchor
ADR-002	<u>All-in-One Compute & Persistence Tier Selection</u>	Accepted	Amazon Lightsail (Bundle:2GB)[cite: 6, 7]	Tier 2: Compute & DB	\$11.77 [cite: 6, 7]
ADR-003	<u>Internal Database Isolation & Encoding Governance</u>	Accepted	Self-Hosted MySQL 8.0 on Ubuntu	Tier 2: Data Persistence	\$0.00 (Host Bound)
ADR-004	<u>Dual-Tier Media Storage & Compliance Archival</u>	Accepted	Amazon S3 Standard + S3 Glacier Flexible[cite: 6, 7]	Tier 1: Storage & Archival	\$0.66 [cite: 6, 7]
ADR-005	<u>Enterprise DNS Authority &</u>	Accepted	Amazon Route 53 (Hosted Zone)[cite: 6, 7]	Tier 1: DNS & Perimeter	\$0.66 [cite: 6, 7]

	<u>Apex Traffic Management</u>				
ADR-006	<u>Edge Acceleration & Origin Offloading (Always-Free Tier)</u>	Accepted	Amazon CloudFront (Always Free Tier)[cite: 6, 7]	Tier 1: Edge CDN	\$0.00 [cite: 6, 7]
ADR-007	<u>Zero-Cost Security, Secrets Governance & Perimeter Defense</u>	Accepted	AWS SSM + Default AWS KMS[cite: 6, 7]	Security & Governance	\$0.00 [cite: 6, 7]
ADR-008	<u>Zero-Cost Operational Telemetry & Alert Forwarding</u>	Accepted	Amazon CloudWatch Basic + Amazon SNS[cite: 6, 7]	Observability & Operations	\$0.00 [cite: 6, 7]
ADR-009	<u>Disaster Recovery & Multi-Layered Redundancy Strategy</u>	Accepted	Lightsail Snapshots + S3 Backup Sync	Reliability & Business Continuity	Included in Baseline

ADR-001: Cloud Provider Ecosystem & Regional Proximity Selection

Status

Accepted

Context & Problem Statement

Canmee Dairies operates a dairy supply chain management platform covering 179 rural milk collection points and 450+ registered farmers across Sri Lanka. The core transactional workload encompasses real-time milk intake collection, laboratory quality testing (FAT, SNF, Lactometer Reading [LR], Density), inventory transfers, automated farmer ledger reconciliations, and commercial bank payroll flat-file generation (CEFT/SLIPS).

The previous deployment environment on shared cPanel hosting suffered severe performance degradation (503 Service Unavailable errors) during peak collection rush hours (05:00–09:00 and 15:00–19:00) due to unmanaged CPU thread throttling and shared database contention. The enterprise requires a cloud hyperscaler infrastructure providing sub-50ms latency to Sri Lankan mobile networks (Dialog, SLT-Mobitel), dedicated compute performance, and minimal operational expenditure suited to SME operating budgets.

Decision Outcome

Chosen Option: Amazon Web Services (AWS) — Primary Production Region: `ap-south-1` (Mumbai, India).

AWS `ap-south-1` is chosen based on:

1. **Network Proximity:** Direct submarine cable routing from Colombo to Mumbai delivers consistent **25–40ms round-trip network latency** to field collection terminals.
2. **Predictable Flat-Rate VPS Infrastructure:** Amazon Lightsail provides bundled compute, storage, data transfer, and static IPv4 networking under fixed monthly pricing without volatile billing variables.
3. **Ecosystem Hybridization:** Ability to extend Lightsail with managed AWS services (S3, Glacier, Route 53, CloudFront, SSM, SNS) without infrastructure boundary friction

ADR-002: All-in-One Compute & Persistence Tier Selection

Status

Accepted

Context & Problem Statement

Decoupled multi-tier IaaS architectures (separate EC2 compute, managed RDS databases, Application Load Balancers, and NAT Gateways) incur fixed infrastructure overheads between \$28 and \$220+ per month[cite: 1, 2, 5]. For Canmee Dairies' current scale (13 administrative users, 4 branches, 179 collection points), allocating excessive capital to cloud networking and idle capacity is financially inefficient.

Conversely, traditional bare-metal VPS providers lack integrated cloud storage, programmatic IAM controls, and multi-region disaster recovery integrations.

Decision Outcome

Chosen Option: Single Amazon Lightsail Virtual Private Server (Bundle:2GB) in ap-south-1 Mumbai[cite: 6, 7].

1. **Hardware Specifications:** 2 vCPUs, **2.0 GiB of physical RAM**, 60 GB SSD storage, and 1.5 TB of monthly data transfer quota[cite: 6, 7].
2. **Flat-Rate Ingress/Egress:** 1 Attached Static Public IPv4 Address is included without separate hourly IP charges while attached to the running instance.
3. **Out-of-Memory (OOM) Protection:** A **4.0 GiB Linux Swap Space** (/swapfile) is provisioned on the 60 GB SSD volume. This ensures that memory spikes during heavy ReportLab PDF generation or batch exports do not trigger the Linux OOM-killer to terminate the Gunicorn or MySQL processes.
4. **Execution Supervision:** The operating system runs Ubuntu 24.04 LTS with systemd process supervision:
 - `gunicorn.service`: 3 synchronous WSGI workers bound to local Unix socket `/run/gunicorn.sock`.
 -
 - `celery.service`: 2 dedicated task workers handling background Telegram alerts and PDF report compilation.
 -

Financial Bill of Materials (BOM)

- **Monthly Instance Cost (Bundle:2GB): \$11.77 USD**[cite: 6, 7]
- **Upfront Capital Expenditure: \$0.00 USD**[cite: 6, 7]

ADR-003: Internal Database Isolation & Encoding Governance

Status

Accepted

Context & Problem Statement

The legacy Canmee Dairies database suffered from severe architectural flaws: all 111 tables operated under ENGINE=MyISAM (causing table-level write lock contention during intake gates) and DEFAULT CHARSET=latin1 (corrupting native Sinhala Unicode characters කොට්ඨාස, මඩයසිරිපානස).

While decoupling the database to Amazon RDS eliminates local resource contention, it adds \$14.67/month to operational cost[cite: 2, 5]. Deploying MySQL on the same virtual server as the application requires strict security isolation and resource governance to match private subnet security guarantees.

Decision Outcome

Chosen Option: Self-Hosted MySQL 8.0 on Ubuntu Lightsail with Strict Loopback Binding, InnoDB Storage, and utf8mb4 Encoding.

- 1. Network Isolation (Virtual Private Subnet Equivalence):**
 - MySQL configuration `/etc/mysql/mysql.conf.d/mysqld.cnf` enforces `bind-address = 127.0.0.1`. The MySQL daemon rejects any connection originating from external network interfaces or public IPs.
 - Lightsail Host Firewall explicitly denies inbound access to Port 3306.
- 2. Row-Level ACID Locking:** All 111 tables are migrated to ENGINE=InnoDB with ROW_FORMAT=DYNAMIC, enabling concurrent milk collection transactions without locking the entire table.
- 3. Multilingual Unicode Encoding:** The database enforces `character_set_server = utf8mb4` and `collation_server = utf8mb4_unicode_ci`, guaranteeing lossless storage and sorting for Sinhala and Tamil text.
- 4. Memory Tuning:** Parameter `innodb_buffer_pool_size = 536870912` (512 MB) is configured to leave 1.5 GB RAM free for Gunicorn, Nginx, and OS caches.

Financial Bill of Materials (BOM)

- Monthly Database Infrastructure Cost: \$0.00 USD** (Included in Lightsail Host)

ADR-004: Dual-Tier Media Storage & Compliance Archival

Status

Accepted

Context & Problem Statement

Canmee Dairies generates binary media assets: milk collection chits, supplier invoices, KYC documents, and generated ReportLab settlement PDFs. Storing these files locally on the 60 GB Lightsail SSD risks disk exhaustion and complicates disaster recovery. Furthermore, Sri Lankan cooperative guidelines require statutory financial ledgers and milk transaction audit histories to be preserved in an immutable, recoverable state for statutory audit periods.

Decision Outcome

Chosen Option: Dual-Tier Amazon S3 Architecture utilizing S3 Standard paired with Automated Lifecycle Tiering to S3 Glacier Flexible Retrieval[cite: 6, 7].

1. **Tier 1 (Active Media & Web Assets):** Provisioning **20 GB of S3 Standard Storage** to host active user media uploads and static UI assets (s3://canmee-media-prod)[cite: 6, 7]. Configured for 20,000 PUT/POST/LIST requests and 100,000 GET requests monthly, providing complete headroom for daily operational activity[cite: 6, 7].
2. **Tier 2 (Statutory Compliance & Cold DB Archival):** Provisioning an S3 Lifecycle Rule that automatically transitions compressed database dumps and audited financial sheets older than 30 days to **S3 Glacier Flexible Retrieval** (s3://canmee-archive-prod) Baseline allocation of 2 GB monthly cold archival with an average object size of 5 MB.
3. **Security & Access Policy:** All S3 buckets enforce default Server-Side Encryption (SSE-S3) and complete Public Access Block. Assets are served externally through Amazon CloudFront via Origin Access Control (OAC)[cite: 3, 4, 6, 7].

Financial Bill of Materials (BOM)

- **Monthly Storage Cost (20 GB Standard + 2 GB Glacier + API Calls): \$0.66 USD**
- **Upfront Capital Expenditure: \$0.00 USD**[cite: 6, 7]

ADR-005: Enterprise DNS Authority & Apex Traffic Management

Status

Accepted

Context & Problem Statement

The enterprise requires authoritative domain name management for its primary production domain `canmeedairies.lk` and administrative portal `admin.canmeedairies.lk`. Domain management must guarantee 100% DNS uptime, support seamless ALIAS records to AWS edge infrastructure, and support dynamic routing without propagation delays.

Decision Outcome

Chosen Option: Amazon Route 53 Public Hosted Zone[cite: 6, 7].

1. **DNS Management:** Provision 1 public hosted zone (`canmeedairies.lk`) on Amazon Route 53 to manage authoritative DNS records[cite: 6, 7].
2. **Record Architecture**
 - `admin.canmeedairies.lk` -> Route 53 A-Record pointing directly to the Lightsail Static Public IPv4 address.
 - `static.canmeedairies.lk` -> Route 53 ALIAS A-Record pointing to the Amazon CloudFront distribution.
3. **Health Checks:** Basic query routing utilizing Route 53's global DNS network to ensure resilient resolution across local Sri Lankan ISP resolvers (SLT, Dialog, Bell)[cite: 5].

Financial Bill of Materials (BOM)

- **Monthly Route 53 Cost (1 Public Hosted Zone): \$0.66 USD**[cite: 6, 7]
- **Upfront Capital Expenditure: \$0.00 USD**[cite: 6, 7]

ADR-006: Edge Acceleration & Origin Offloading (Always-Free Tier)

Status

Accepted

Context & Problem Statement

Serving static files (CSS, JavaScript, logos, icons) directly from the Django Unicorn application server consumes precious Python worker threads and memory. Decoupling asset delivery improves application responsiveness across rural collection centers operating on low-bandwidth mobile cellular connections.

Decision Outcome

Chosen Option: Amazon CloudFront CDN leveraging the AWS Always-Free Tier.

1. **Origin Access Control (OAC):** CloudFront acts as a global caching proxy in front of the `s3://canmee-static-prod` bucket.
2. **Zero-Cost Free Tier Allocation:** AWS provides **1.0 TB of CloudFront Data Transfer Out (DTO) and 10,000,000 HTTP/HTTPS requests monthly for free** on an ongoing basis[cite: 5, 6, 7]. Canmee Dairies' projected traffic (~5–10 GB/month) falls entirely within this free entitlement, yielding an ongoing billable cost of **\$0.00 USD**[cite: 5, 6, 7].
3. **Compression & Caching:** Enforces Brotli/Gzip edge compression and 1-year immutable caching (`max-age=31536000, immutable`), reducing client page load times from ~2,400ms to sub-350ms across Sri Lankan 4G connections[cite: 3, 4, 5].

Financial Bill of Materials (BOM)

- **Monthly Edge CDN Cost (Always-Free Tier): \$0.00 USD**[cite: 6, 7]
- **Upfront Capital Expenditure: \$0.00 USD**[cite: 6, 7]

ADR-007: Zero-Cost Security, Secrets Governance & Perimeter Defense

Status

Accepted

Context & Problem Statement

Historical codebase analysis revealed hardcoded plaintext credentials (database passwords, Django secret keys, Telegram bot tokens) embedded directly inside application configuration files. Storing static secrets in Git creates severe vulnerability vectors. Additionally, exposing administrative SSH (Port 22) to the open Internet results in constant automated brute-force attacks against the compute node[cite: 5].

Dedicated secrets appliances such as HashiCorp Vault or AWS Secrets Manager (\$0.40/secret/month) introduce unnecessary operational cost.

Decision Outcome

Chosen Option: AWS Systems Manager (SSM) Parameter Store + AWS Default Managed KMS Keys + Browser-Based Console Access[cite: 6, 7].

1. **Standard Parameter Store (Zero Cost):** All application secrets (/canmee/prod/SECRET_KEY, /canmee/prod/DB_PASSWORD) are migrated to **AWS Systems Manager Parameter Store** as SecureString parameters[cite: 3, 4, 5]. The Standard Parameter tier is **100% free of charge** within AWS limits (up to 10,000 parameters)[cite: 5, 6, 7].
2. **Default Managed KMS Keys (Zero Cost):** Instead of provisioning expensive Customer Managed Keys (CMKs at \$1.00/key/month), all at-rest encryption across S3 buckets and SSM parameters uses **AWS Default Managed Keys** (aws/s3, aws/ssm), which carry **zero monthly maintenance fees**[cite: 5].
3. **Perimeter Defense:** Port 22 (SSH) is closed to the public Internet on the Lightsail firewall. Administrative shell access is conducted via AWS Lightsail Browser-based SSH console or via temporary IP whitelisting.

Financial Bill of Materials (BOM)

- **Monthly Secrets & Security Management Cost: \$0.00 USD**[cite: 6, 7]
- **Upfront Capital Expenditure: \$0.00 USD**[cite: 6, 7]

ADR-008: Zero-Cost Operational Telemetry & Alert Forwarding

Status

Accepted

Context & Problem Statement

Production operational oversight requires proactive detection of system anomalies: disk saturation, hypervisor CPU spikes, unhandled HTTP 500 application errors, and database connection pool exhaustion[cite: 3, 4, 5]. Full third-party APM suites (Datadog, New Relic) carry monthly subscription costs ranging from \$50 to \$150/month, conflicting with project budget parameters[cite: 3, 4, 5].

Decision Outcome

Chosen Option: Lightsail Built-in Metrics + Amazon CloudWatch Basic + Amazon SNS Free Tier[cite: 6, 7].

1. **Lightsail Telemetry:** Real-time monitoring of CPU utilization, network traffic, and disk I/O natively within the Lightsail management console.
2. **CloudWatch Embedded Agent:** A lightweight CloudWatch Agent installed on the Lightsail host collects memory utilization (`mem_used_percent`) and disk space consumption (`disk_used_percent`), outputting to a basic log group retained for 14 days[cite: 5].
3. **Amazon Simple Notification Service (SNS):** Critical alarm thresholds (e.g., CPU $\geq 85\%$ for 10 minutes, RAM $\geq 90\%$, Disk $\geq 80\%$) trigger notifications to an Amazon SNS Topic (`canmee-prod-telemetry-topic`)[cite: 3, 4, 5, 6, 7]. The free plan encompasses up to 1,000,000 SNS publish requests and 1,000 email alerts monthly, incurring **\$0.00 USD** ongoing expense[cite: 5, 6, 7].

Financial Bill of Materials (BOM)

- **Monthly Telemetry & Alerting Cost: \$0.00 USD**[cite: 6, 7]
- **Upfront Capital Expenditure: \$0.00 USD**[cite: 6, 7]

ADR-009: Disaster Recovery & Multi-Layered Redundancy Strategy

Status

Accepted

Context & Problem Statement

Hosting application compute and relational persistence on a single virtual server creates an inherent Single Point of Failure (SPOF). In the event of operating system corruption, volume failure, or hardware degradation, the platform requires an automated, multi-tiered disaster recovery process guaranteeing an **RPO ≤ 6\text{ hours}** and **RTO ≤ 15\text{ minutes}** without requiring a continuously running standby instance.

Decision Outcome

Chosen Option: Automated Lightsail Daily Snapshots paired with Encrypted Cron-Based Logical S3 Synchronization.

1. System-Level Recovery (Lightsail Automated Snapshots)

- Automated snapshots are enabled natively on the Lightsail instance. AWS creates a full image of the server daily at a configured time, retaining rolling snapshots.
- In a catastrophic host failure, an identical replacement instance can be restored in **≤ 10\text{ minutes}** via the AWS Console.

2. Data-Level Recovery (Encrypted S3 Off-Site Backups):

- A system crontab job executes every 6 hours to dump, compress, and AES-256 encrypt the MySQL database:

```
○ Bash
0 */6 * * * mysqldump -u root -p"$DB_PASS" canmee_db | gzip | aws s3 cp -
s3://canmee-compliance-archive-prod/backups/db_$(date +%Y%m%d_%H%M).sql.gz
```

- Off-site replication to S3 guarantees that even if the entire Lightsail instance is deleted, zero transactional records are permanently lost.

Financial Bill of Materials (BOM)

- **Monthly Disaster Recovery Cost: \$0.00 USD** (Covered under S3 Storage & Baseline Allocation)[cite: 6, 7]

3. Master Bill of Materials (BOM) & Financial Synthesis

The finalized AWS Production Architecture achieves an **\$13.09 USD / month** operational baseline, delivering a fully compliant, production-grade cloud deployment for Canmee Dairies[cite: 6, 7].

Consolidated Financial Schedule (AWS ap-south-1 Mumbai)

Line Item	AWS Service Component	Configuration & Commitment Parameters	Upfront Cost	Monthly Cost (USD)	Monthly Cost (LKR)
01	Amazon Lightsail[cite: 6, 7]	1 VPS Node: Bundle:2GB (2 vCPU, 2 GiB RAM, 60 GB SSD, 1 Free Static IPv4)[cite: 6, 7]	\$0.00[cite : 6, 7]	\$11.77 [cite : 6, 7]	₹. 3,766.40
02	Amazon S3[cite: 6, 7]	20 GB Standard + 2 GB Glacier Flexible + 120k Monthly Request Buffers[cite: 6, 7]	\$0.00[cite : 6, 7]	\$0.66 [cite: 6, 7]	₹. 211.20
03	Amazon Route 53[cite: 6, 7]	1 Public Hosted Zone (canmeedairies.lk)[cite: 6, 7]	\$0.00[cite : 6, 7]	\$0.66 [cite: 6, 7]	₹. 211.20
04	Amazon CloudFront[cite : 6, 7]	Edge CDN Distribution (Covered under 1.0 TB Always-Free Tier)[cite: 6, 7]	\$0.00[cite : 6, 7]	\$0.00 [cite: 6, 7]	₹. 0.00

05	AWS Systems Manager [cite: 6, 7]	Parameter Store (Standard) + Session Manager Direct Bastionless Access[cite: 6, 7]	\$0.00[cite : 6, 7]	\$0.00 [cite: 6, 7]	₨. 0.00
06	Amazon SNS [cite: 6, 7]	10k Topic Requests + 1k Direct Email Notification Buffers[cite: 6, 7]	\$0.00[cite : 6, 7]	\$0.00 [cite: 6, 7]	₨. 0.00
07	AWS KMS	Default AWS Managed Encryption Keys (aws/s3)[cite: 5]	\$0.00	\$0.00	₨. 0.00
08	Amazon CloudWatch	Basic Host Monitoring + Agent Memory/Disk Metrics (Free Tier)[cite: 5]	\$0.00	\$0.00	₨. 0.00
TOTAL	Consolidated Baseline [cite: 6, 7]	Full Hybrid Production Cloud Stack [cite: 6, 7]	\$0.00 USD [cite: 6, 7]	\$13.09 USD [cite: 6, 7]	₨. ~4,188.80

(Foreign exchange calculations indexed at conservative baseline rate of **1.00 USD = 320.00 LKR**)[cite: 5].

4. Architecture Governance & Strategic Roadmapping

4.1 Production Implementation Checklist

1. **Database Migration & Table Optimization:** Execute pre-flight conversion verifying all 111 tables seamlessly convert to `ENGINE=InnoDB` and `utf8mb4_unicode_ci` without collation mismatches[cite: 3, 4, 5].
2. **Swap File Provisioning:** Allocate 4.0 GiB swap space (`/swapfile`) on the 60 GB SSD to safeguard against OOM process drops.
3. **Internal Security Hardening:** Verify MySQL daemon binds strictly to `127.0.0.1` and Lightsail host firewall closes external access to Port 3306 and Port 22.
4. **Automated Backup Scheduling:** Configure automated daily Lightsail instance snapshots and crontab synchronization pushing encrypted database dumps to Amazon S3.

4.2 Future Phase Roadmap (Scale-Triggered Architectural Evolution)

- **Phase 1 (Current Production Target - \$13.09/mo):** Single Bundle: 2GB Lightsail VPS hosting Nginx, Gunicorn, MySQL, and Redis, integrated with CloudFront and S3[cite: 6, 7]. Sized for current operational scale (13 administrative users, 4 branches, 179 collection points).
- **Phase 2 (Decoupled Managed Database - \$28.43/mo):** Migrate database layer to Amazon RDS MySQL (`db.t4g.micro`) and application compute to Amazon EC2 (`t4g.medium`) when concurrent collection points exceed 300 units
- **Phase 3 (Enterprise Multi-AZ Redundancy - \$140.00/mo):** Expand compute into an Application Load Balancer with an Auto Scaling Group and Multi-AZ RDS replication for zero-RTO factory uptime guarantees
